

Odor Reduction for Clay

Heating some Chavant clays in clay warming devices, often required to soften the material, can produce a distinct non-harmful odor. Many clients have successfully reduced odor emissions from clay ovens by attaching activated charcoal filters to an exhaust vent often found on ovens.

Activated Charcoal (aka Activated Carbon) Filters are available from various manufacturers. Check the Thomas Register under Filters: Activated Carbon. One model that we have seen is produced by Airfiltronix Corporation of Clifton, NJ. They can be reached at 1-800-452-8510 or through their web site www.airfiltronix.com.
